

REPO SUMMARY

BVRB3R Platform

One-page summary built from repository evidence on March 11, 2026.

NEXT.JS 15 + SUPABASE-READY + PWA

WHAT IT IS

BVRB3R Platform is a multi-role, barbershop-first operating system for The BVRB3R Shop(TM) & Co. In this repo it unifies marketing, discovery, booking, shop operations, growth tooling, and PWA/mobile activation in one Next.js app.

WHAT IT DOES

- Public marketing site with auth, features, pricing, and contact routes.
- Booking, appointment transitions, checkout, and live operations APIs.
- Role dashboards for owner, manager, front desk, barber, and client users.
- Marketplace discovery, barber profiles, leaderboards, style/top feeds, waitlists, and haircut-now matching.
- Service, follow, referral, engagement, ranking, and attribution workflows.
- Trust plus mobile/PWA features: verification, disputes, reports, offline shell, deep links, and push.

HOW TO RUN

1. Install Node.js 22+ and npm 10+.
2. Copy .env.example to .env.local.
3. For the fastest start, keep NEXT_PUBLIC_AUTH_MODE=demo and PAYMENTS_PROVIDER=mock.
4. Run npm install.
5. Run npm run dev, then open <http://localhost:3000>.

EVIDENCE USED

README, package.json, route structure under app/, app/layout.tsx, components/providers/app-providers.tsx, app/api/*, provider files in lib/operations, lib/marketplace, lib/mobile, lib/payments, plus public/sw.js and app/manifest.ts.

WHO IT'S FOR

Primary persona: a barbershop owner/operator managing daily shop operations and growth. Additional surfaces exist for managers, front desk staff, barbers, and clients.

HOW IT WORKS

- UI: Next.js App Router pages for marketing, auth, role dashboards, discovery, and public barber profiles.
- Client runtime: React Query plus a PWA provider for install, offline, deep-link, and push UX.
- API layer: app/api routes cover operations, marketplace, engagement, trust, mobile, and payments.
- Domain services: lib/operations, lib/marketplace, lib/engagement, lib/mobile, lib/trust, and lib/payments.
- Persistence: demo mode uses in-memory state; Supabase mode uses server/admin clients and persisted tables; payments switch between mock and Stripe.
- Flow: browser/PWA ->

Observed wiring from repo evidence:

AppProviders adds React Query and PWA state; route handlers call provider abstractions that choose demo or Supabase/Stripe backends at runtime.

Flowing target. Not found in repo.
